Summary

Since 2015 Lönelotsarna (the Wage Pilots), a network of equal pay experts, publishes annual reports on pay differences across the Swedish labour market. By comparing occupations across sectors and assessing them using a job evaluation system, occupations have been organised into jobs of equal value. Thanks to Sweden's comprehensive salary data all equivalent occupations can then be compared to expose the structural wage gap.

This is our eighth report. Here we investigate the structural wage gap in 2023, as well as the wage development since 2018 for female-dominated occupations in relation to others of equal value. We also highlight patterns observed through our studies and the conclusions we can draw from them. At the end we suggest actions that could reduce the structural wage gap.

Key findings in brief

- In 2023, the structural wage gap in Sweden between female-dominated and other occupations of equal value was 20 percent. On average, the salary in female-dominated occupations was SEK 8,900 (€767) lower than other occupations of equal value. The wage gap decreased from 22 percent in 2015 to 19 percent in 2018 and 2021. However, the trend reversed, and the gap widened again.

- Female-dominated occupations get paid less than other occupations even when they require similar levels of skills, education, responsibility or working conditions.

- Police officers received an average salary increase of SEK 3,500 (€310) through a special initiative by the government to combat crime. No similar initiative has been made for the female-dominated occupations that are important in combating and preventing crime, such as social work professionals, primary school teachers, and preschool teachers, even though the demands in these occupations often are higher than for police officers.

- The wage gap between female- and male-dominated occupations facing labour shortages are large and growing. For example, the wage gap between professional midwifes and engineering professionals in electrical, electronics and telecommunications has increased by SEK 600 (€52) since 2018. The wage difference between primary school teachers and physical and engineering science technicians has increased by SEK 800 over the same period. Assistant nurses, home care and homes for the elderly earn SEK 5,600 (€483) less than electricians, installation and service, and the gap has increased by SEK 1,100 (€95).

Work of equal value

Structural wage differences refer to wage disparities between groups of women and men that cannot be explained by differences in job requirements, the complexity of the work, or the employees' performance and skills. Instead, these pay gaps may stem from value discrimination, meaning that certain occupations and tasks are considered less valuable or important, often those traditionally performed unpaid by women. Unlike other forms of discrimination, value discrimination targets groups rather than individuals, meaning that even men in female-dominated occupations are affected because the job itself is undervalued.

Lönelotsarna has created an aggregated measure of the structural wage gap as a complement to the usual wage gap statistics that either measure the wage gap in equal work or between women and men. To our knowledge, we are unique in measuring the wage gap between occupation of equal value.

We have conducted a job evaluation of all occupations in the Swedish labour market. The definition of an occupation follows the Swedish Standard Classification of Occupations 2012 (SSYK), which includes 429 occupations. SSYK is based on the international classification ISCO-08 and has been developed by Statistics Sweden and the Swedish Public Employment Service.

The job evaluation is based on the criteria for work of equal value outlined in the Swedish Discrimination Act. The factors include education, problem-solving and social skills, responsibility, leadership and working conditions. Each occupation has been grouped and classified into female-dominated (more than 60 percent women) and other occupations (i.e. occupations that are male-dominated or has a balanced sex distribution) based on the aggregated score in the job evaluation.

From this, we have created twelve groups of comparable occupations with equivalent job requirements, hereafter called equivalent occupations. By linking the official wage statistics to our groups of equivalent occupations, wages having been transformed into monthly full-time salary, we have a material where we can compare wages in equivalent occupations. We use the concept average monthly salary, converted to full-time. The salary includes base salary, fixed supplements, and an average of variable supplements. Our data includes 4.5 million employees aged 20–68, 2.2 million women and 2.3 million men.

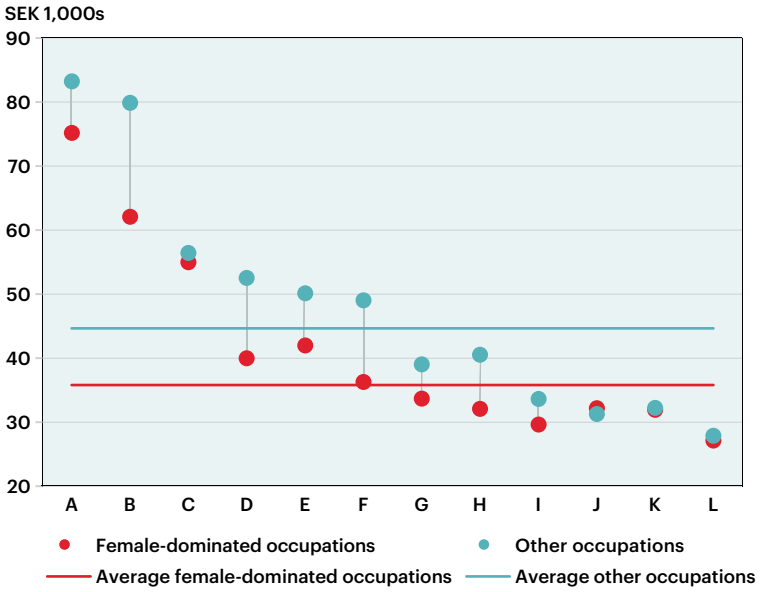
For more information about our method, see page 16.

The structural wage gap

During the studied period the structural wage gap decreased from 22 percent in 2015 to 19 percent in 2018 and 2021. However, this trend reversed, with the 2023 analysis showing an increase in the gap to 20 percent.

Female-dominated occupations have an average monthly salary of SEK 35,800 (€3,086), while other equivalent occupations have an average monthly salary of SEK 44,700 (€3,853), meaning that female-dominated occupations earn on average SEK 8,900 (€767) less per month than male-dominated or gender-balanced.

Average monthly salary in female-dominated vs. other occupations in equivalent groups, 2023



The figure illustrates how wage differences vary across groups. Average salaries decrease with lower levels of job requirements; occupations with the highest job requirements have the highest wages and salaries decline proportionally with job requirement levels. A notable trend is that female-dominated occupations consistently have lower salaries than others in all groups of equivalent occupations except in Group J.

Group highlights

- **Group A and B**: These groups hold many senior executives. In Group A, the average salary difference between female-dominated and other occupations is SEK 8,100. **Group B**, which has the largest salary gap of all, SEK 17,800, contains specialist physicians as well as executives.

- **Group C** includes managers and occupations requiring long university education, such as professional midwifes veterinarians, engineering professionals, and architects. The salary difference is SEK 1,400.

- **Group D:** Most occupations here require higher education, including teachers and specialist nurses. The salary gap is SEK 12,500, largely because three large female-dominated occupations (preschool teachers, social work professionals, and primary school teachers) have lower salaries than others in the group.

- **Group E** includes occupations requiring both short and long university studies, such as physiotherapists, personnel and human resources specialist, system testers and test managers, and physical and engineering science technicians. The salary difference is SEK 8,200.

- **Group F** includes social insurance officers, software developers, and train operators, academic qualifications are often required. The salary gap is SEK 12,800 due to higher-paid male-dominated occupations in this group.

- **Group G** covers occupations that does not demand higher education, such as assistant nurses, home care and homes for the elderly, electrical equipment installers and repairers, and plumbing and central heating fitters. Salary difference: SEK 5,300.

- **Group H** includes child care workers, recreation and related associate professionals, rail and road construction workers, and agricultural and industrial machinery mechanics and repairers. Salary difference: SEK 8,400.

- **Group I** occupations include personal assistants, home-based personal care and related workers, machine operators, and building caretakers. Salary difference: SEK 4,000.

- **Group J** includes beauticians and related workers, pharmacy technicians, and assemblers. Female-dominated occupations earn SEK 900 more than others.

- **Group K** includes shop staff and warehouse and terminal staff. The salary gap is the smallest, at SEK 300.

- **Group L** includes cleaners and helpers in offices, hotels and other establishments and telemarketers. Salary difference: SEK 700.

Combatting and preventing crime

At present, violent crime is the focus of politics and public debate in Sweden. Significant investments have been made to strengthen the police and judiciary system, including an average raise of SEK 3,500 (€310) in police salaries. However, no corresponding investment has been carried out to strengthen preventive measures to reduce crime. Signs of problems often appear as early as in preschool age, and society needs to act at this stage.

We have studied the salaries of some female-dominated occupations that have legal means to intervene, but not police powers, and where employees interact with children, young people, and their families at an early stage.

Average monthly salary in some occupations, differences in 2023 and 2021 (SEK)

Female-dominated occuptions	Male-dominated occupations	Difference 2023	Difference 2021
Social work professionals 38,800	Police Officers 40,800	2,000	500
Primary school teachers 39,900	Police Officers 40,800	1,700	500
Preschool teachers 34,700	Police Officers 40,800	6,100	4,100
Child care workers 26,800	Security guards 32,900	6,100	5,800

Social work professionals, primary school teachers, and preschool teachers, all female-dominated occupations, earn less than police officers, despite their work requirements often being higher. The wage gap has increased since 2021. Currently, these female-dominated occupations earn between SEK 1,700 (€147) and SEK 6,100 (€526) less per month than the male-dominated police officers. There is also a significant wage gap between security guards, who require only brief training, and child care workers, who need a high school education. The gap is SEK 6,100.

The wage gap is growing. This is not solely due to investments made in occupations combatting crime. It is also a result of collective agreements being based on percentage increases rather than fixed amounts, which benefits those who already have higher salaries. Female-dominated occupations typically start with lower pay than comparable male-dominated as in the case of childcare workers versus security guards. Even though both groups have received the same percentage wage increase, the pay gap has grown by SEK 300 in two years. Even if these occupations were to receive the same percentage increase in the future, the wage gap will continue to grow.

The market as wage setter

A common explanation for wage differences across occupations is that wages reflect supply and demand, and thus are determined by market conditions. However, the role of the market in wage formation is not simple, as negotiations, collective agreements, and other regulations affect the wage setting. There is also a persistent value discrimination, as work performed by women continues to be valued lower than work performed by men, even when there is a significant shortage of labour in female-dominated occupations.

Since 2018, Lönelotsarna has compared wage levels in pairs of equivalent occupations where there is a significant labour shortage according to the Swedish Public Employment Service's forecasts for shortage occupations.

The table below shows average salaries for five pairs of occupations with equivalent job requirements.

Average monthly salary in some labour shortage, 2018 and 2023

Occupation		Monthly salary (SEK)		Development	
		2018	2023	SEK	Percent
F-dom	Professional midwifes	40,100	47,200	7,100	17.7
M-dom	Engineering professionals in electrical, electronics and telecommunications	46,100	53,800	7,700	16.7
	Difference	6,000	6,600	600	
F-dom	Primary school teachers	34,100	39,100	5,000	14.7
M-dom	Physical and engineering science technicians	41,500	47,300	5,800	14.0
	Difference	7,400	8,200	800	
F-dom	Occupational therapist	32,000	36,600	4,600	14.4
M-dom	Software- and system developers	44,300	52,800	8,500	19.2
	Difference	12,300	16,200	3,900	
F-dom	Assistant nurses, home care and homes for the elderly	28,400	31,900	3,500	12.3
M-dom	Electricians, installation and service	32,900	37,500	4,600	14.0
	Difference	4,500	5,600	1,100	
F-dom	Medical secretaries and related associate professionals	27,100	30,800	3,700	13.7
M-dom	Vehicle mechanics and repairers	29,700	33,500	3,800	12.8
	Difference	2,600	2,700	100	

We can see that

- Professional midwives earn 6,600 SEK (€575) less per month than engineering professionals in electrical, electronics and telecommunications.
- Primary school teachers earn SEK 8,200 (€715) less than physical and engineering science technicians despite being in a higher-valued group.
- Occupational therapists earn SEK 16,200 (€1,412) less than system testers and test managers.
- Assistant nurses, home care and homes for the elderly earn SEK 5,600 (€488) less than electrical equipment installers and repairers.

- Medical secretaries and related associate professionals earn SEK 2,700 (€235) less than vehicle mechanics and repairers.

The development since 2018 is discouraging. Despite long-term labour shortages in most of the studied occupations, the wage gap remains large between female-dominated and male-dominated occupations of equivalent value. Although professional midwives and primary school teachers have had a higher percentage wage increase than engineering professionals and physical and engineering science technicians, the wage gap has still increased, as the female-dominated occupations had lower salaries to begin with.

The wage for assistant nurses, home care and homes for the elderly has increased by 12.3 percent since 2018, which corresponds to SEK 3,500. However, electricians, an occupation of equal value, have seen their wages rise by 14.0 percent and the wage gap between the two has thus increased with SEK 1,100. The wage development for occupational therapists and medical secretaries and related associate professionals follows the same pattern.

Public and private sector

This study includes 4.5 million employees aged 20–68 years: 1.367 million in the public sector, 984,000 women and 384,000 men. In the private sector there are 3.129 million employees, 1,221,000 women and 1,908,000 men.

Average monthly salary (SEK) in public sector and private sector, 2023

	Public sector			Private sector		
	Women	Men	Difference	Women	Men	Difference
Women-dominated occupations	35,700	36,200	500	35,300	36,100	800
Other occupations	48,400	46,300	-2,100	43,900	44,900	1,000
Total	37,200	40,500	3,300	39,200	43,800	4,600

Both women and men have higher salaries in the private sector than in the public sector. For women, the salary is SEK 2,000 higher in the private sector, while for men it is SEK 3,300 higher. The wage gap between women and men is larger in the private sector than in the public.

For women-dominated occupations wages are slightly higher in the public sector compared to the private, although the difference is small. Men earn more than women in female-dominated occupations in both sectors.

The highest average salaries are found in other occupations (male-dominated or gender-balanced) within the public sector. This category also includes the highest salaries for women, which is linked to the large number of women in managerial roles in the public sector.

Interestingly, the wage gap here favours women by SEK 2,100. This can be explained by the dominance of municipally employed people in the public sector, where women are the majority. In the group of other occupations, there is a significant proportion of high-earning women, while men are relatively few, leading to this overall outcome.

Work with people, data and objects

It is sometimes argued that wages and status decline when occupations transition from male-dominated to female-dominated fields, reflecting a societal perception that men's work is more valuable. While this holds true in many cases, it is also notable that occupations involving work with people often carry a lower, and potentially declining, status. Our studies suggest that the wage disparity stems not only from female dominance in certain occupations but also from the undervaluation of work focused on human development, health, safety, and well-being compared to tasks involving data or objects.

We have categorized occupations based on three types of tasks: work with people, with data (text, numbers, or other symbols), or with objects (physical materials of various kinds in manufacturing or service). The occupations are evenly distributed across the three categories, but the number of employees in each occupation varies, as shown in the table below.

Percentage distribution of number of employees by category of work, 2023

	People	Data	Objects	Total
Female-dominated occupations	74	21	6	100
Gender-balanced occupations	34	40	26	100
Male-dominated occupations	4	45	51	100
Total	42	33	25	100

42 percent of the 3.8 million employees[1] in the studied occupations work with people. Of these, 74 percent are in female-dominated occupations, while 4 percent are in male-dominated occupations. Examples of male-dominated occupations in this category include police officers, security guards, and firefighters. Female-dominated occupations, on the other hand, are primarily found in healthcare, social care, and education.

The lowest wages are found in occupations involving objects. Female-dominated occupations in this category include cleaners and animal breeders, while male-dominated include shop sales and warehouse and terminal staff. Among gender-balanced occupations involving objects,

1 Managers have been excluded.

examples include cooks and cold-buffet managers, and restaurant and kitchen helpers.

Average monthly salary (SEK) by category of work, 2023,

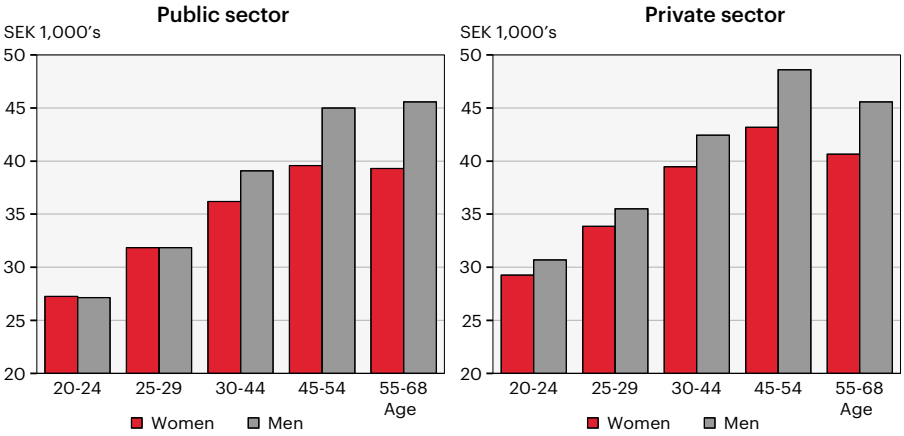
	People	Data	Objects
Female-dominated occupations	34,000	39,300	28,200
Gender-balanced occupations	45,100	48,300	29,000
Male-dominated occupations	36,100	50,300	34,100
Total	35,600	46,600	32,600

Working with people yields lower wages than working with data, regardless of whether the occupation is dominated by women, men, or has a balanced sex distribution. Female-dominated occupations consistently have the lowest wages, whether the work involves people, data, or objects.

Age and wage

Men generally earn more than women across most age groups, regardless of work experience measured by age. While wages increase for both sexes up to the 45–54 age group, they decrease thereafter for both women and men, except for men in the public sector.

Average monthly salary by sector and age, 2023



In the public sector, women in the youngest age group earn slightly more than men (a difference of less than SEK 100), but the wage gap widen significantly in favour of men starting from the 30–44 age group. In the private sector, men earn more than women from the start of their careers, with the gap increasing in every subsequent age group except the oldest.

Work experience, measured in terms of age, has less impact on women's wages than on men's. An explanation for the widening pay gap after the age of 30 is that women take more parental leave and part-time work than men, which negatively affects their wage and career progression.

Education and wage

An analysis of educational levels required for different occupations[2] reveals that women earn less than men at every level of education. The gap is most pronounced in occupations requiring higher education and smallest in those requiring shorter education.

Average monthly salary (SEK) by according to the occupation's requirements for education, 2023

Level of education	Public sector			Private sector		
	Women	Men	Differ-ence	Women	Men	Differ-ence
Post-secondary education 3 years or more	41,800	46,400	4,600	48,500	54,900	6,400
Post-secondary education 2–3 years	36,000	39,200	3,200	42,200	47,800	5,600
Secondary and short post-secondary education	30,500	30,700	200	32,000	34,100	2,100
Primary school education	26,700	27,600	900	26,800	28,100	1,300

This means that women's investment in education does not yield the same financial returns as it does for men. For some female-dominated occupations, education can even be a losing proposition. In the trade union Saco's tool "Lifetime Earnings for Academics"[3], it is possible to calculate the lifetime earnings of various educational paths. The data shows that preschool teachers, librarians, occupational therapists, dental hygienists, and physiotherapists have lower lifetime earnings than people without any higher education at all. In other words, these employees incur a financial loss from their education and would have higher lifetime earnings if they had not pursued a university degree.

Recurring patterns

Through our years of studying salaries, it has become evident that sex is the key explanation for wage differences, regardless of how we divide and analyse data. Simply put, being a woman pays less, and especially working in a female-dominated occupation. We have identified some recurring patterns:

- **Salaries in female-dominated occupations are consistently lower than in other occupations with similar levels of skills, education, responsibility or working conditions.** Often, they are even lower compared to occupations with lower requirements.

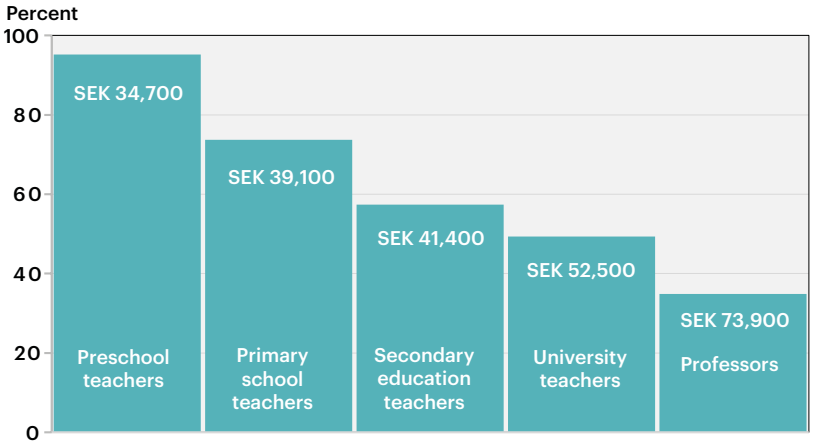
2. The first number in the SSYK code indicates level of education. Managers have been excluded.

3. https://www.saco.se/en/about-saco/our-issues/

- **The wage gap is not decreasing.** Even though female-dominated occupations sometimes receive a higher percentage wage increase, the actual increase in money is smaller because they start with lower salaries. This means that the wage gap cannot be closed unless female-dominated occupations receive higher real wage increases in money than equivalent occupations.
- **Female-dominated occupations often have a compressed wage structure.** When we examine the wage dispersion within shortage occupations and compare women-dominated with other equivalent occupations, we find that female-dominated occupations generally have a lower wage dispersion than the others.
- **Wage differences are cemented early on.** Men earn more than women from the start, and the differences increase with age. In other words, professional experience measured by age has less impact on women's wages than on men's.
- **Education does not always pay off for women.** The wage differences are greatest in occupations that require higher education, which means that women and men receive different returns on their education.

It is also interesting to observe how old patterns persist within the educational professions by studying salaries of preschool teachers, primary school teachers, secondary school teachers, university and college lecturers, and professors. These occupations are not equivalent, but they illustrate another observation: the older the students or pupils, the higher the salary and the lower the proportion of women.

The height of the bars indicates the percentage of women in the occupation, the monthly salary, 2023, in each bar.



What is “the right” salary?

A re-evaluation of female-dominated occupations is necessary to reach equal pay. But what is the “right” salary level?

If we assume that salaries in occupations that are not female-dominated are “correct” based on job requirements and market assessments, it should imply that these are also the “right” levels for equivalent female-dominated occupations. As described earlier, our calculations show that wage increases ranging from SEK 2,700 to SEK 16,200 are required for female-dominated shortage occupations to reach the same salary levels as equivalent male-dominated shortage occupations.

In a study from 2015 including wages of 2.3 million employees, we calculated the total sum of wage gap between equivalent female- and male-dominated occupations. We estimated the total cost at SEK 76 billion (€6,6 billion) per year. This figure could also be described as the cost of the systemic undervaluation of female-dominated occupations. For context, the total wage sum in 2015 was SEK 1,589 billion (€138 billion). According to our calculations, the cost of addressing the structural wage gap in 2015 amounted to 4.8 percent.

Change is possible!

Many of the female-dominated occupations are found in the public sector. It is unrealistic to expect municipalities and regions, where the largest female-dominated groups are employed, to finance the wage increases needed to eliminate structural pay gaps. At the same time, competitive wages and attractive working conditions are necessary to recruit and retain professionals to the publicly funded welfare sector.

There is a strong consensus (on paper) on the importance of addressing wage issues from a gender equality perspective among the social partners. A review by the Swedish National Mediation Office of the collective agreements across the labour market shows that all collective agreements include provisions about equal pay. However, reality demonstrates that these contractual structures fail to achieve this goal. A fundamental issue is that since collective agreements apply for specific sectors or occupations, no party assumes or takes responsibility for the overall picture. The Swedish wage norm, where the industrial sector sets the “benchmark”, makes it almost impossible to adjust relative wages between sectors and occupations, thereby perpetuating structural wage gap.

A holistic approach is necessary. All parties – unions, employers, the government, and parliament – must take responsibility for systemic changes across sectors and develop policies to redistribute wage funds equitably and allow increases in the relative wages within female-

dominated occupations, without undermining wage-setting mechanisms. Transparent wage-setting practices and regular job evaluations are critical for addressing these issues.

Investments on a societal level are needed. There are precedents for political intervention in wage formation, most recently with salary increases for police officers. Denmark faces similar challenges to Sweden, including difficulties in recruiting to welfare-related occupations. There, a Wage Structure Committee analysed recruitment and wage levels in the public sector, leading to a government allocation of DKK 3 billion (€402 million) to be jointly distributed for an extraordinary investment in selected public sector occupations until 2030. This could serve as an example to follow.

The Swedish law requires employers to conduct an annual pay survey including analysis of wages for work of equal value across female- and male-dominated work within the same organisation. Employers with ten or more employees has to document the results and make action plans for pay adjustments.

The pay survey is a good tool to discover and adjust unexplained wage differences, and the regulations will become even more efficient with the implementation of the EU Pay Transparency Directive. However, currently there is virtually no monitoring of compliance with the law. Since the establishment of the Equality Ombudsman in 2009, efforts have primarily focused on information activities. The lack of monitoring has significantly contributed to many employers failing to conduct wage surveys. In practice, it remains almost risk-free to violate the law, and too many employers take advantage of the lack of active law enforcement.

Another problem is that employers cite market arguments to justify wage differences between female-dominated and other occupations, without explaining how salaries have been assessed against market conditions. Even in cases where the Ombudsman has monitored wage surveys, market arguments have been accepted without further explanations. We find that the Equality Ombudsman should give more priority to supervising wage surveys. We also argue that the government must allocate sufficient funds to enable the Equality Ombudsman to carry out its supervisory mandate, as this will become even more comprehensive with the implementation of the EU Pay Transparancy Directive. The Discrimination Act should also be clarified to specify under which circumstances proven recruitment difficulties – commonly referred to as market wage levels – should be considered valid reasons for deviating from the principle of equal pay.

The Equivalent jobs tool

Here you can read more about the classification of occupations, how we use wage statistics and how we have constructed and applied the Equivalent jobs tool.

Classification of occupations

The classification follows the Standard for Swedish Occupational Classification, SSYK 2012, which consists of 429 occupations. SSYK is based on an international classification (ISCO-08) and has been developed by Statistics Sweden and the Swedish Public Employment Service. We have evaluated 425 of the occupations covered by SSYK. The three military occupations and Politicians have been excluded.

SSYK is primarily intended to classify work by occupation. The fundamental division by occupation considers both the type of work, i.e., the tasks performed by a person, and the qualifications normally required to perform this work. The aim is to create an occupational classification that reflects today's occupational structure and meets the requirements for international reporting and comparability as far as possible.

SSYK has a hierarchical structure with four levels, where the first level, occupational area, indicates the qualification level for the occupation. The criteria for division at other levels are primarily based on similarities in the specialization required. This may include specific knowledge needed, tools or machines used, materials processed, or the type of goods and services produced.

A problem with the SSYK classification is that many male-dominated occupations are divided into specialized codes depending on tasks, whereas roles in female-dominated occupations often are treated as a single category. The most striking example is process operators that are divided into 23 occupations depending on the industry or material they work with: chemicals, paper, metals, rubber, sawmills, etc. A total of approximately 81,000 employees are included. This can be compared with assistant nurses, home care and homes for the elderly, employing 128,000 people, with a single occupational code.

Another difficulty in using SSYK as a basis for job evaluation is that occupational codes may include work of varying complexity.

We have chosen to evaluate occupations as they are defined in SSYK and illustrate this with the example of police officers. The occupation 'Police officers' comprises approximately 17,000 individuals and includes 22 different job titles, from Chief Inspector to Police Trainee, but is classified as a single occupation in SSYK.

We have evaluated police officers according to the SSYK description: "Maintains public order. Intervenes in legal violations and investigates crimes. Establishes contacts and gathers information from various

sources to prevent crimes. Monitors and directs traffic". The police website further describes duties and educational requirements for police officers, which we have considered in the evaluation.

Our material covers the entire labour market, and the grouping of equivalent occupations, that we consider correct on an overall level, should not be applied to single workplaces, in salary negotiations nor as arguments for comparing female-dominated occupations with one another. To assess which occupations are equivalent in a specific workplace, a customized job evaluation should be used, describing and evaluating the demands among the jobs present there.

Wage statistics

We have used official wage statistics from Statistics Sweden to identify female- and male-dominated occupations and those with a balanced gender distribution. Occupations with more than 60.4 percent women have been classified as female-dominated, those with more than 60.4 percent men as male-dominated, and the remainder as gender balanced occupations.

"Salary structure statistics" is an annual survey. Employers provide information on various salary components, occupations, and scope of service. Salary statistics for the public sector are comprehensive, while those for parts of the private sector, especially small and medium-sized enterprises, are based on sample surveys. Companies with at least 500 employees are surveyed annually.

We use the concept average monthly salary, converted to full-time. The salary includes base salary, fixed supplements, and an average of variable supplements. This salary concept, therefore, cannot be compared to the concepts used in salary negotiations, that usually do not contain supplements.

We have calculated an average salary for the female-dominated occupations in each group and compared this to the average salary for other occupations in the group. In calculating the average salary, the number of individuals in each occupation has been considered.

The equivalent jobs tool

Job evaluation is a systematic method for assessing the demands and complexities of work to determine which work hold equivalent value, where the work itself is different. Job evaluation is not objective science but a method to systematize job requirements and make values visible.

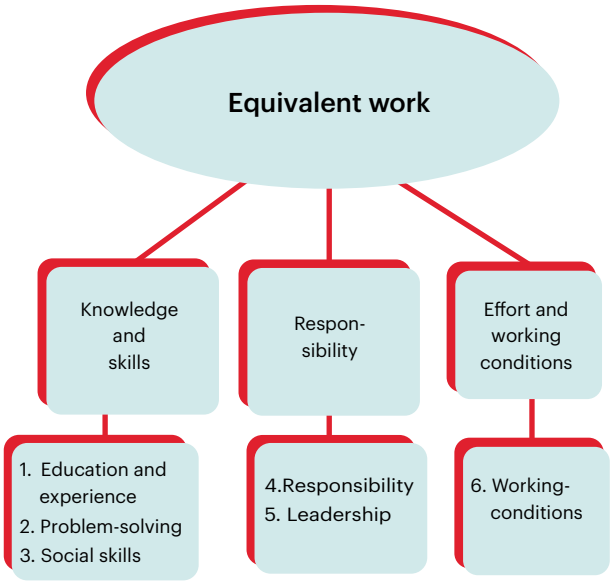
The Lonelots tool is a weighted multi-factor and gender-neutral job evaluation tool that can be downloaded free of charge from www.lonelotsarna.se. The system is based on the main areas of the Swedish Discrimination Act — knowledge and skills, responsibility, effort, and working conditions, factors that are globally recognized as essential for defining equivalent work

The tool consists of two parts: a job evaluation system to assess which work is equivalent and a pay audit tool that provides the tables and charts needed to map and analyse wages in equal and equivalent work. The system is a basic model with factors, aspects, and levels designed so that each user can adapt the method to their operations.

For our studies of the macro-level structural wage gap, we have customized the factors and levels in the Lonelots tool and call this version the **Equivalent jobs tool**. We have weighted the factors to give them an importance that we believe reflects the labour market's assessments. In our adaptation, we have considered what is possible to evaluate based on information available in SSYK, other sources, and our own experience with job evaluation.

The Equivalent jobs tool provides a unique opportunity to evaluate and compare demands across almost all occupations, offering an overall measure of structural pay disparities and thereby highlighting the undervaluation of female-dominated occupations.

Factor plan



The factor plan contains three main areas, divided into six factors.

Main area	Factor	Number of levels
Knowledge and skills	1. Education and experience	5
	2. Problem-solving	5
	3. Social skills	4
Responsibility	4. Responsibility	10
	5. Leadership	4
Effort and working conditions	6. Working conditions	4

The following section describes the factors and levels in the tool and how they have been applied and how we have applied them in the job evaluation.

Main area Knowledge and skills

We use the time required for education to assess the knowledge needed to perform the work. We use the term "skills" to describe the expertise required. Skills can be seen as an application of theoretical knowledge and are divided into intellectual and social skills. In our method, intellectual skills are referred to as problem-solving.

Factor 1. Education and experience

This factor assesses the demands for knowledge that is normally acquired through theoretical education and the demands for training necessary for the work. It refers to the education and experience typically required at the present time to perform the work.

We have identified the educational requirements for all 425 occupations by gathering information from several sources: the websites Framtid.nu, Utbildning.se, and the Swedish Public Employment Service's Career Guide, as well as websites of government agencies, universities, trade unions, and others. Occasionally, we reviewed job advertisements to determine the requirements currently set by individual employers. We then assigned each occupation to the appropriate difficulty level that we could verify using the mentioned sources.

For experience requirements, we evaluated occupations that, in addition to secondary education, require an apprenticeship period before a professional license/certificate can be issued. We also considered experience requirements from subordinate positions when evaluating supervisors and managers.

Factor 2. Problem solving

This factor assessed four aspects: analysis, creativity, independence, development.

ANALYSIS: assesses problem-solving skills. This involves analysing various types of problems that may arise and the types of solutions that

may be required. Problems may concern people, facts, theories, objects, or occurrences.

CREATIVITY: assesses the capacity of creating something new or combining existing things in a new way.

INDEPENDENCE: assesses the degree of freedom of action and decision-making when solving problems.

DEVELOPMENT: assesses demands concerning flexibility and adaptability, the ability of being situationally responsive with short time for preparations.

Factor 3. Social skills

This factor assesses four aspects: communication, cooperation, cultural understanding and service.

COMMUNICATION: assesses the demands of the work in terms of communicating information individually or in dialogue with others as well as conveying information in a pedagogical and efficient manner orally or in writing.

COOPERATION: assesses the demands of the work of cooperating with others in such a way that the work is pursued efficiently while at the same time due consideration is shown for colleagues.

CULTURAL UNDERSTANDING: assesses the demands of the work in terms of meeting people in different contexts and understanding different cultures. Cultures refer to linguistic, ethnic, religious, or social cultures.

SERVICE: assesses the demands of the work in terms of providing service to customers, users, clients, the public etc. Internal service is also included.

We have applied the factor by assigning the highest level to a few occupations that involve interacting with or treating people in particularly vulnerable situations, certain artistic professions, and some occupations aimed at producing text and images.

We used the second-highest level for professions with significant demands on social skills, such as those in education, healthcare, or social care, as well as occupations whose primary task is to produce various forms of communication. This also applies to managers within these areas.

Main area Responsibility

There are different types of responsibility. Overall responsibility is often referred to as formal responsibility. Typically, this is not always exercised in practice by the person responsible, it is often borne by a

single individual and is not limited in terms of time. It is a responsibility that one carries as part of a professional role all the time.

Factual responsibility presupposes knowledge of how the duties are to be performed and often involves physical activity or effort. Unlike formal responsibility, factual responsibility may be shared with others. It may also be exercised for a limited time.

The different types of responsibility are not clearly delineated but tend to overlap, and the work may require different types of responsibilities, sometimes simultaneously. The consequences for the organisation, third parties, or the employees themselves, if the responsibility is not properly fulfilled, are significant when assessing the level of difficulty.

Factor 4. Responsibility

This factor assesses five aspects: Responsibility for people, for economic values, planning, development and results.

RESPONSIBILITY FOR PEOPLE: assesses responsibility for people's health, well-being, safety, and development from physical, mental, and social perspectives. These people may be recipients of care, pupils, customers, the general public, or others dependent on the activities conducted. 'Exercise of public authority' is also considered here, i.e. to determine or take actions concerning an individual's rights, obligations and social benefits, or the exercise of coercive measures.

RESPONSIBILITY FOR ECONOMIC VALUES : assesses responsibility for material resources, such as equipment and machinery, goods and inventory, properties, and premises. It may also involve environmental or natural resources. Even responsibility for handling immaterial values in written or digital form is considered, as well as responsibility for the security, maintenance, and preservation of sensitive information such as trademarks and trade secrets.

RESPONSIBILITY FOR PLANNING: may involve identifying needs, formulating objectives and plans for current and future operations, prioritizing, planning projects and efforts, preparing a budget, acquiring resources.

RESPONSIBILITY FOR DEVELOPMENT: may include creating or changing the organisation or parts of it, managing projects, adapting and advancing the organisation or part of it towards specific goals.

RESPONSIBILITY FOR RESULTS: may include reporting, accounting, quality assessments, follow-up and the phaseout of activities. It may also include responsibility for and analysis of goal fulfilment, monitoring the implementation of plans, and responsibility for deciding when changes are needed.

Responsibility is the most challenging factor to assess. In the Lonelots tool, there are three factors for responsibility: responsibility for

people, economic values, and planning, development, and results. This allows each factor to be evaluated individually.

However, since we have performed an evaluation at the macro level, we have instead consolidated the information we have about each occupation, considering both factual and formal responsibility weighting together the various aspects.

Factor 5. Leadership

This factor assesses the responsibility that a manager has for leading and evaluating the work of others and modifying or determining working terms and conditions. Leadership may involve guidance and feedback, communicating visions and goals, ensuring goal fulfilment as well as making sure that employees' competencies are used and developed.

In applying this factor, we have followed the SSYK occupational nomenclature and assessed "level one managers" at the highest level of requirements "level two managers" at the next highest, and supervisors at next to lowest level. All other occupations have been evaluated at the lowest level, meaning no formal responsibility for supervision or management.

Main area Effort and working conditions

The effort required to perform a job always involves some form of exertion. Work is also carried out under conditions specific to the job. The level of effort may depend on the content of the work as well as the working environment. Here, effort is assessed in terms of physical, mental, or emotional strain.

Working conditions reflect the nature of the work and assess the discomfort the employee may be exposed to due to the physical, mental, or social environment, as well as the risks of injury or illness due to the tasks themselves or due to the environment in which the tasks are carried out.

The level placement depends on how long and how often the employee is exposed to these conditions and whether they can influence or mitigate the strain, assuming that existing safety regulations are being followed.

Factor 6. Working conditions

The factor assesses the discomfort an employee may face due to the physical, psychological, or social environment, as well as the risks of injury or illness arising from the tasks themselves or the environment in which the tasks are performed.

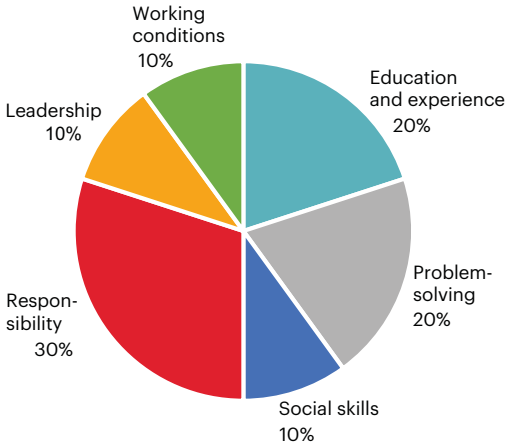
In our assessment of working conditions, occupations with very high demands for physical exertion or performed in environments with a

risk of serious injury or illness have been assigned the highest level. Occupations with significant mental demands, as well as those that may involve major communication challenges and strong emotional strain – such as in social services, healthcare, or education – have been placed at the next highest level. However, most of the evaluated occupations fall under the two lowest levels for working conditions.

Weighting

The factors included in a job evaluation system have different weights, expressed as the percentage they are assigned. In the Equivalent jobs tool, Responsibility has been given the highest weight, at 30 percent. The significance of this factor is explained by its highly complex nature. The factors Education and Problem-solving each carry a weight of 20 percent.

Weighting in the Equivalent jobs tool



We have considered various weighting alternatives and tested and quality-checked the outcomes. We find that our chosen model, which emphasizes knowledge and responsibility, best reflects the work requirements on today's labour market.

Classification into equivalent occupations

To compare female-dominated occupations with others of the same level of difficulty, we have dived the results of the job evaluation into twelve intervals. Occupations within each interval form a group of equivalent occupations.

When making the interval division, we aimed at creating equal-sized score intervals, with a similar number of occupations and employees in each group. However, this was not possible, as the number of employees

in different occupations varies significantly. The majority of occupations can be found between groups C and I, with fewer occupations at both the highest and lowest evaluations. The number of employees follows a similar pattern, with the largest number of individuals in groups G and H, where large occupations such as assistant nurses, home care and homes for the elderly, caregivers, and commercial sales representatives, can be found.

Occupations with equivalent requirements

425 occupations are listed in alphabetical order in each group of equivalent occupations.

SSYK	Name
Group A	
1230	Administration and planning managers
1341	Architectural and engineering managers, level 1
1511	Clinical and operations managers in health care, level 1

4223	Telephonist-switchboard operators

About the authors

Anita Harriman has worked with wage formation and equal pay within government agencies and other organisations. She has published several works on methods for individual wage setting and equal pay. Anita is one of the authors of the Lonelots tool for job evaluation.

Lena Johansson is an expert in gender statistics and has worked at Statistics Sweden (SCB) and the Swedish Government Offices. She has contributed to numerous governmental inquiries and authored publications on equal pay.

Marie Trollvik has extensive experience from both the private and public sectors. She has headed transnational projects on equal pay and women and leadership, as well as a large program for gender mainstreaming in Swedish municipalities and regions.

About Lönelotsarna

is a non-profit organisation working for equal pay by:

- Spreading knowledge, raising awareness, and developing methods,
- Providing and developing the Lonelots tool for job evaluation,
- Serving as a platform for development, exchange, and collaboration for professionals using the Lonelots tool, and
- Managing the website www.lonelotsarna.se.
